AI Sathi: Requirements and Implementation Plan

Version 1 · Basic SRS for the pilot · Team [team name]

1 · PURPOSE

AI Sathi is a phone-friendly web app for a state-funded college network that already gives students generative-AI access. It shows students what AI use is allowed on each assignment, offers an optional study helper in Hindi, Hinglish and English, collects a short explain-your-work note with each submission, and gives faculty and administrators a simple view of understanding and fairness. It does not try to increase AI usage.

2 · USERS

User	What they need	How they use it
Students	Know the AI rule, get optional help, show what they understand	Phone browser, often low-end, limited data, Hindi or Hinglish
Faculty	Set the AI level for a task and judge understanding fairly	Phone or laptop
Administrators	Keep rules consistent and see whether some groups fall behind	Laptop, overall reports only
Placement teams	Later: overall readiness figures	Not a version-1 user

3 · INPUTS AND OUTPUTS

Inputs

- Faculty: assignment details, AI level (green, amber, red), rule wording, rubric
- Student: submitted work, short explain-your-work note, language choice, how AI was used
- Student (optional): study-helper questions and device type for the fairness view
- College: list of students, courses and departments

Outputs

- Student: rule label in English and Hindi, helper answers, submission receipt, marks and comments
- Faculty: submissions with notes, AI-suggested rubric points (for review), marks
- Administrators: overall report on rule clarity, explain-your-work results and gaps by device type and language; small groups hidden

4 · WORKFLOW

1	**Faculty set the rule**	Choose green, amber or red for the task, write the rule, and approve the Hindi and English wording.
2	**Student sees the rule**	The label appears before the student can open or submit the task.
3	**Student works and submits**	Optional study helper (off on red tasks). Student submits the work with a short note on their thinking.
4	**Faculty review**	AI drafts rubric points from the submission. Faculty edit, confirm and give marks.
5	**Administrators review**	Overall report shows rule clarity, learning results and gaps. Admins decide what to change.

5 · FUNCTIONAL REQUIREMENTS

ID	The system shall	Priority
FR1	Let faculty set a green, amber or red AI-use level and a short rule for each assignment.	Must
FR2	Show every rule in English and Hindi. Faculty approve the Hindi or Hinglish wording before students see it.	Must
FR3	Show students the rule before they open or submit the assignment.	Must
FR4	Let students submit work and a short explain-your-work note in English, Hindi or Hinglish.	Must
FR5	Offer an optional text-only study helper that follows the assignment level and is switched off on red tasks.	Must
FR6	Ask students to say in one short field whether and how they used AI.	Should
FR7	Show faculty each submission with its note, and AI-suggested rubric points marked as suggestions. Marks are saved only after faculty confirm.	Must
FR8	Show administrators overall results by device type and language, and hide groups below a minimum size.	Should
FR9	Keep study-helper conversations private to the student. They are never shown to faculty or administrators.	Must
FR10	Work on a low-end phone and a slow connection, with no app install.	Must

6 · AI AND HUMAN RESPONSIBILITIES

AI is responsible for

- Drafting Hindi and Hinglish versions of rule text, for faculty approval
- Answering study questions when a student asks, within the task's AI level
- Drafting explain-your-work questions and rubric suggestions with a short reason
- Summarising overall trends in plain language
- Labelling everything it produces as AI-generated

AI never grades, judges misuse, ranks students or reads private chats.

People are responsible for

- Faculty: set the level, approve wording, give every grade and decide on any misuse concern
- Students: choose whether to use AI, disclose it, and write their own explanation
- Administrators: own the policy, set the minimum group size and act on the fairness report
- Project team: test Hindi and Hinglish text with students and review failures

7 · CONSTRAINTS

- Students use low-end phones on limited data, so the app is text-first, light and needs no install.
- Languages in version 1: Hindi, Hinglish and English.
- The app builds on the AI access the college already provides. We still need to confirm what that access allows.
- No reading of private conversations. Any claim about a student's ability must come from submitted task work.
- Student data is kept to the minimum needed and handled under the college network's own rules, which we still need to confirm.
- Small team and short timeline, so the pilot covers one or two departments.

8 · FAILURE HANDLING

If this happens	The system does this
AI service is slow or down	Rules and submissions keep working. The helper shows a clear “unavailable” message. Nobody is blocked from submitting.
Connection drops while submitting	The draft is saved on the phone and retried. The student sees a “saved” or “not sent yet” status.
Hindi or Hinglish text looks wrong	Faculty can edit it before publishing. Students can flag it and read the English version.
AI suggests a wrong or unfair rubric point	Faculty can edit or ignore it. Suggestions are never saved as marks automatically.
Faculty have not set a rule	The task shows “Rule not set, ask your faculty”. Faculty are reminded. No rule is assumed.
A group is too small to report	It is hidden from the fairness report so no individual can be identified.

9 · ACCEPTANCE CRITERIA

- No task can be opened or submitted without the student first seeing its AI rule.
- Faculty can create a task with a level and an approved English and Hindi rule using one short form.
- The study helper is off on red tasks and follows the level on green and amber tasks.
- No grade is saved until a faculty member confirms it.
- No screen or report shows any student’s helper conversations.
- The overall report shows gaps by device type and language, and hides small groups.
- Test users on low-end phones and with a preference for Hindi or Hinglish can finish the full student flow without help.
- Failures in section 8 are tried on purpose and behave as described.

10 · VERSION 1 EXCLUSIONS

- Automatic grading or AI-detection of student work
- Reading, storing for staff or scoring private AI conversations
- Decisions or reports on misuse by individual students
- Placement and employability dashboards
- Voice input, offline app and app-store install
- Integration with the college’s learning system (version 1 uses manual entry)
- Languages beyond Hindi, Hinglish and English
- Lending devices or paying for tools for students

11 · IMPLEMENTATION PLAN

Phase	What happens	Done when
1. Confirm	Check the college’s AI access, student data limits and faculty’s current rules. Agree a rule template.	Open questions answered
2. Build (Round 2)	Student, faculty and administrator screens, Hindi and Hinglish text, sample data.	Tested by students on low-end phones
3. Pilot	One or two departments, a few real assignments.	Acceptance criteria met, failures logged
4. Review and widen	Check rule clarity, faculty effort and the fairness gap. Fix what failed.	Administrators decide whether to widen
